

Known issues

- None

[5.9.9.99 r10] – 2025-12-1

Fixed

- Now an automatic switch to new default WWW and backup folders when old folder paths are detected
- A forever-bug where the viewer window would not return the main window to a non-maximized state following a temporary full-screen display
- Many timeline playback inconsistencies regarding use of the Esc key, single-camera “scale to fill”, and black playback windows when the clips list was set to solo by camera when the viewer window was not.
- An issue with the viewer open where sometimes the “minimized” live camera view header would have show image corruption.

Changed

- Logging of Trigger/Alert states to combine them (roll-up) more appropriately
- The status/log shows a rolling 24-hour view

Added

- A more generous hit area for resizing the main window from the status bar area, especially bottom/right corner

[5.9.9.99 r9] – 2025-11-30

Fixed

- Windows socket code for improved shutdown and re-use of sockets. This should improve stability when cameras are often going offline or AI services become unresponsive.

[5.9.9.99 r8] – 2025-11-24

Changed

- New full installer for 6.0 pre-release
- References to version 6 specific web server files and updates
